Schedule

02/2011 – 07/2012

MMHS uses the possibilities offered by mobile technologies and social networks for **patient education** and for therapeutic monitoring and follow-up.

In particular, it has been designed as a didactic and pedagogical electronic device for children and adolescents with a **chronic disease**. Its aim is to help them to better cope with their illness.

The initial project called **e-posology** was the first part of a global patient information management solution, providing relevant medical information in animated form. MMHS is a targeted and **customisable mobile device** that will consolidate the previous developments.

MMHS is a **mobile application** providing customised **widgets** to persons suffering from a chronic disease. The appropriate widgets are chosen from a database. These widgets can have a general scope or be very specific (e.g. girls under 12 suffering from asthma), which makes them suitable for a wide range of patient categories. Every patient has several widgets to learn more about their disease, to test their knowledge, to organise a follow-up and to communicate with fellow sufferers. The mobile app is available for iOS and Android.
